Scope

Business continuity has become a top priority for most enterprises and their IT staff. Every minute lost due to downtime can lead to potentially high costs and services that can no longer be guaranteed. No matter how well the network is designed, problems can still arise. Jarviss defines Incident Management as the key process in Service Operation. It is the speed with which the service is responded to and restored after an incident has occurred. By definition, an Incident is an unplanned interruption of an IT service or a reduction in the quality of an IT service.

Definition

An information security incident in an event whereby data held by Jarviss, in any format, is compromised by being lost, destroyed, altered, copied, transmitted, stolen, used or accessed unlawfully or by unauthorised individuals whether accidentally or on purpose.

Process description

Reporting

All information security incidents should be reported immediately via an Odoo ticket.
The report should include full and accurate details of the incident, including who is reporting the incident; what type of data is involved (not the data itself unless specifically requested); if the data relates to people and if so, how many people are involved.

The internal IT team and the CISO are responsible for maintaining a confidential log of all information security events.

When reporting incidents, Incident Management tries to understand the impact and urgency of the incident in order to act accordingly. The combination of impact and urgency is called Priority:

- The impact is the measure of the effect of the Incident, Problem, Change, or any other IT service management record. The impact is usually measured by the impact on service levels.
- Urgency is the time span until the Incident, Problem or Change has a significant impact on the IT service. This is how quickly action needs to be taken to resolve it.
- Priority is a way to identify the relative importance of an Incident, Problem, or Change. Priority provides a common understanding of the relative importance of Incidents and Problems.

The following process is followed in the event of an incident:

Jarviss uses a Priority Matrix which is a 4 to 4 scale. For example, a high impact and high urgency would result in a Priority 1 Incident. A Low Impact and Low Urgency Incident would have the lowest priority.

1. P1 Incidents or Urgent: a P1 incident has a very large impact on the organization and has great visibility, possibly resulting in financial and reputational damage. Such incidents are given the highest priority.
2. P2 incidents or High priority: these hinder a limited part of the organization or do not cause immediate nuisance but have a high risk of consequential damage if not remedied. These incidents need to be given the necessary focus to be resolved asap to avoid further escalation.
3. P3 incidents or low priority are typically non-urgent incidents that only hinder 1 individual, for example.
4. P4 incidents: this essentially concerns service requests that have no impact and are a low priority.

Investigation and Response

The internal IT team or SOC team will report an incident to the CISO (when not available: Managing Director) who will consider the severity of the incident, and where appropriate, instigate a Response Team. There are 2 ways an incident can be created.

1) manual via portal.jarviss.be
2) Automatically security incident created by our MXDR tools in SOC helpdesk team

When the SOC team has investigated the automatically created ticket and confirm that this is a real incident, they will create a ticket in the ISO portal (portal.jarviss.be) and inform the CISO (when not available: Managing Director).

The CISO (when not available: Managing Director) will lead the Response team and membership will depend on the type and severity of the incident. The response team will be responsible for investigating the circumstances and effect of the information security incident. An investigation will be started into material breaches within 24 hours of the breach being discovered, where practicable.

The investigation will establish the nature of the incident, the type of data involved, whether the data is personal data relating to individuals or otherwise confidential or valuable. If personal data is involved, associated individuals must be identified and, if confidential / valuable data is concerned, what the legal and commercial consequences of the breach may be.

The investigation will consider the extent of the sensitivity of the data, and a risk assessment performed as to what might be the consequences of its loss. This will include risk of damage and/or distress to individuals and the institution.
The response team is responsible for formally documenting the incident and associated response. This information will (as a minimum) be subject to review by the CISO or Managing Director.

Containment

The Response Team will determine the appropriate course of action and the required resources needed to limit the impact of the breach. For instance, this may require isolating a compromised section of the network; alerting relevant staff or contractors; changing access codes/locks or shutting down critical equipment.

Eradication

The Response Team removes all components related to the incident, all artefacts left by the attacker (malicious code, data, etc.) and close every hole or vulnerability that was used by the hacker to intrude in the first place.

The clean-up should not be started before having a full picture of the incident! This means that the Response Team should start by determining its root cause. Furthermore, the Response Team should make sure to have at least looked at all components with the same vulnerability; they may also be infected.

Whenever the decision is taken to start eradicating the incident, it is important to be fast, synchronized and thorough, in order to give the adversary as little chance as possible (ideally none) to respond.

The eradication can take many forms. It often implies actions such as:

- Running a virus or spyware scanner to remove the offending files and services
- Updating signatures
- Deleting malware
- Disabling breached user accounts
- Changing passwords of breached user accounts
- Identifying and mitigating all vulnerabilities that were exploited
- Identifying security gaps and fixing them

Recovery

Appropriate steps will be taken to recover data losses and resume normal business operation. This might entail attempting to recover any lost equipment, using backup mechanisms to restore compromised or stolen data and changing compromised passwords. For incidents that involve a suspected or actual criminal offence, all efforts will be made to preserve evidence integrity.

Review

Once the incident is contained, a thorough review of the event will be undertaken by the Response Team, to establish the cause of the incident, the effectiveness of the response and to identify areas that require improvement.

Recommended changes to systems, policies and procedures will be documented and implemented as soon as possible thereafter. Targeted training may be offered to the department affected.

Lessons learned

Jarviss will discuss the (outcome of the) incidents during the biweekly Operations meetings. In case there is relevant information for other staff members not participating to the Operations meetings, this will also be shared with the relevant stakeholders.

Roles, responsibilities and communication overview

Rol	Responsibilities	Communication overview
Help desk employee	Reply to all notifications Provide 1st line support on all notifications If necessary, escalation of the ticket to 2nd line or SOC team Follow-up of all open tickets Taking care of communication Closing tickets after confirmation	– Telephone +32 78 31 99 88 – ERP (Odoo) portal.jarviss.be
2de line support consultant	Provide 2nd line support on the passed tickets from the 1st line support If necessary, escalation of ticket to supplier Follow-up of tickets passed on to supplier	– Telephone depending which consultant on the technology – ERP (Odoo) portal.jarviss.be
SOC team	Reporting Information Security Events Logging and Investigating Cyber Security Events Taking Corrective and Preventive Actions	- Telephone +32 78 31 99 88 - E-mail soc@jarviss.be - ERP (Odoo) portal.jarviss.be
CISO	First escalation level Follow up on whether SLAs are being achieved Follow-up satisfaction Monitoring the operation of the service desk	- Telephone +32 497 44 03 22 - E-mail wim.desmet@jarviss.be - ERP (Odoo) portal.jarviss.be
Managing director	Escalation contact	- Telephone +32 473 56 18 03 - E-mail jo.vanderschueren@jarviss.be - ERP (Odoo) portal.jarviss.be
Logistics	Stock management, spare parts Follow-up of back-to-back contracts with suppliers Follow-up of current contracts of customers, expiry dates	– Telephone +32 9 394 99 11 – E-mail logistics@jarviss.be

		– ERP (Odoo) portal.jarviss.be
